

User will search for the data they need may this be in a date range of up to 2 years.

This will then display the charts for either singular or company if compared between 2 companies.

This also ties in with the offline mode where they retrieved the stored data from the local database.

From searching the data it will get validated if it falls within the range of maximum 2 years and then get fetched through an External API like Yahoo Finance.

Which will go through the Stored data through the local database and this will all tie back with the user
