Use Case steps Definition

User will search for the data they need may this be in a date range of up to 2 years. This will then display the charts for either singular or company if compared between 2 companies.

This also ties in with the offline mode where they retrieved the stored data from the local database.

From searching the data it will get validated if it falls within the range of maximum 2 years and then get fetched through an External API like Yahoo Finance.

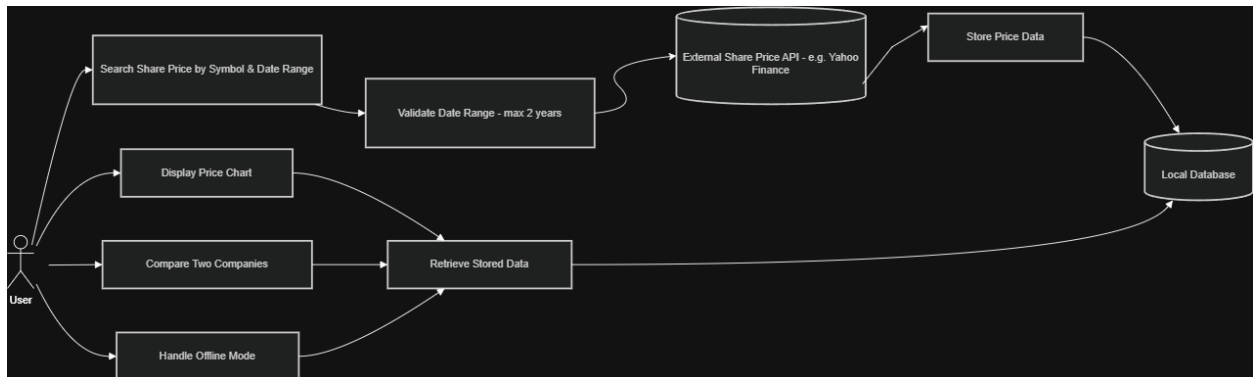

Which will go through the Stored data through the local database and this will all tie back with the user.

System Interfaces Diagram

System Interfaces

The System Interface Diagram shows the main entry point of the system, the functions that users or other systems can call. In this case it defines two key interfaces: one for company related operations (like retrieving company information or prices) and one for users related actions (like creating a search request or viewing a chart). This diagrams focuses on what the system can do, not how it does it. It act as a high level contract that describes the available services.

Business Interface Diagram and Collaboration Diagrams

Business Interface Diagram

The Business Interface Diagram explains the business workflow behind the “Get Share Prices” use case. It shows how the user interacts with the system, which components are involved, and the logical steps required to complete the task. It connects the user actions to the system interfaces and highlights the business logic — such as requesting prices, checking data, fetching missing information, and generating a chart. This diagram focuses on *why* each step happens from a business perspective.

Collaboration Diagram

The Collaboration Diagram shows the detailed message flow between system components. It illustrates the sequence of calls: the user sends a request to the controller, the controller calls the service, the service checks the repository, fetches missing prices from an external provider, saves new data, and finally generates and returns a chart. This diagram focuses on *how* the system components communicate to complete the use case.
